

08. 데이터베이스

1. **SQLite**
2. **Oracle**
3. **MySQL**

1. SQLite

□ SQLit

- ▣ 공식사이트 : <http://sqlite.org>
- ▣ 개발자 : 리처드 힙(Richard Hipp)이 2000년 8월 발표 C언어로 개발

□ 특징

- ▣ 파일기반 DBMS, 저메모리, 빠른 처리 속도
- ▣ 오픈소스
- ▣ 별도의 DB 서버가 없어도 쉽고 편리하게 사용할 수 있는 Embedded SQL 엔진
- ▣ 안드로이드, 아이폰 등의 스마트폰에 내장된 DB
- ▣ 표준 SQL 지원

1. SQLite

- **SQLite에서 지원하지 않는 기능**
(<https://www.sqlite.org/omitted.html>)
 - ▣ RIGHT and FULL OUTER JOIN : left outer join은 가능함
 - ▣ Complete ALTER TABLE support
 - ▣ Complete trigger support
 - ▣ Writing to VIEWS : 읽기 전용 뷰만 가능
 - ▣ GRANT and REVOCK
- **SQLite 클라이언트 툴**
 - ▣ <http://www.sqliteexpert.com/>
 - ▣ Personal 64bit 버전 다운로드 및 설치

1.SQLite

□ SQLite 사용

▣ table 생성

```
import sqlite3
print(sqlite3.version)
print(sqlite3.sqlite_version)
```

```
import sqlite3 #SQLite3 라이브러리 로딩
# 테이블 생성
def create_table():
    conn=sqlite3.connect('my_books.db') #데이터베이스 커넥션 생성
    cursor=conn.cursor() # 커서 생성
    #my_books 테이블 생성, 제목, 출판일자,출판사, 페이지수, 추천여부
    cursor.execute("""create table if not exists books(
        title text,
        published_date text,
        publisher text,
        pages integer,
        recommend integer
    )""")
    conn.commit()
    conn.close()
create_table()
```

1. SQLite

□ 데이터 입력

```
import sqlite3
#데이터 입력 함수
def insert_books():
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    cursor.execute("insert into books values('Java','2019-05-20','길벗',500,10)")
    sql='insert into books values(?,?,?,?,?)'
    cursor.execute(sql, ('Python','201001','한빛',584,20))
    items=[
        ('빅데이터','2014-07-02','삼성',296,11),
        ('안드로이드','2010-02-02','영진',526,20),
        ('Spring','2013-12-02','삼성',248,15)
    ]
    cursor.executemany(sql, items)
    conn.commit()
    conn.close()
insert_books()
```

1. SQLite

□ 전체 데이터 출력

```
import sqlite3
def all_books():
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    cursor.execute("select * from books")
    print('[1] 전체 데이터 출력하기')
    books=cursor.fetchall()
    print(type(books))
    print(len(books))

    for book in books:
        print(book)
    conn.close()

all_books()
```

1. SQLite

□ 레코드 개수 정하여 출력

```
import sqlite3
# 데이터 개수 지정하여 출력
def some_books(number):
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    cursor.execute("select * from books")
    books=cursor.fetchmany(number)
    for book in books:
        print(book)
    conn.close()
some_books(3)
```

```
import sqlite3
# 1개의 데이터 출력
def one_book():
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    cursor.execute("select * from books")
    book=cursor.fetchone()
    print(type(book))
    print(book)
    conn.close()
one_book()
```

1. SQLite

□ 조건 지정 및 정렬하여 검색

```
import sqlite3
def big_books():
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    cursor.execute("select title,pages from books where pages>300 order by
pages desc")
    books=cursor.fetchall()
    for book in books:
        print(book)
    conn.close()
big_books()
```

1. SQLite

□ 수정

```
import sqlite3
def update_books():
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    sql='update books set recommend=? where title=?'
    cursor.execute(sql,(200,'Java'))
    conn.commit()
    conn.close()
update_books()
one_book()
```

1. SQLite

□ 삭제

```
import sqlite3
def delete_books():
    conn=sqlite3.connect("my_books.db")
    cursor=conn.cursor()
    sql="delete from books where publisher='한빛'"
    cursor.execute(sql)
    conn.commit()
    conn.close()
delete_books()
all_books()
```

2.Oracle

□ cx_Oracle 설치

- ▣ console창에서 설치
- ▣ pip install cx_Oracle(쥬피터 노트북 종료 후 다시 시작)

```
CREATE TABLE PRODUCT(  
product_id number,  
product_name varchar2(50),  
price number default 0,  
description clob,  
picture_url varchar2(500),  
primary key(product_id));
```

2.Oracle

□ 1개 레코드 삽입

```
import cx_Oracle

def insert_product():
    conn=cx_Oracle.connect("pgm/1234@localhost:1521/xe")
    cursor=conn.cursor()
    sql="insert into product(product_id,product_name,price,description,picture_url)
values(:1,:2,:3,:4,:5)"
    data=(1, '레몬', 1500, '레몬에 포함된 구연산은 피로회복에 좋습니다.',
'lemon.jpg')
    cursor.execute(sql,data)
    cursor.close()
    conn.commit()
    conn.close()

insert_product()
```

2. Oracle

□ 전체 레코드 조회

```
#import cx_Oracle

def all_product():
    conn=cx_Oracle.connect("pgm/1234@localhost:1521/xe")
    cursor=conn.cursor()
    sql="select * from product"
    cursor.execute(sql)
    for row in cursor:
        description=row[3].read() #CLOB 필드 읽는 방법
        data=list(row) # tuple->list로 변경
        data[3]=description
        print(data)
    cursor.close()
    conn.close()

all_product()
```

2.Oracle

□ Python Oracle 연동

복수개 레코드 삽입

```
def insert_many():
```

```
    conn=cx_Oracle.connect("pgm/1234@localhost:1521/xe")
```

```
    cursor=conn.cursor()
```

```
    items=[
```

```
        (2, '오렌지', 2000, '비타민 C가 풍부합니다. 생과일 주스로 마시면 좋습니다.', 'orange.jpg')
```

```
        (3, '키위', 3000, '비타민 C가 매우 풍부합니다. 다이어트나 미용에 좋습니다', 'kiwi.jpg'),
```

```
        (4, '포도', 5000, '폴리페놀을 다량함유하고 있어 항산화 작용을 합니다,', 'grape.jpg'),
```

```
        (6, '딸기', 8000, '비타민 C나 플로보노이드를 다량 함유하고 있습니다,', 'strawberry.jpg'),
```

```
        (6, '귤', 7000, '시네피린을 함유하고 있어 감기 예방에 좋다고 합니다,', 'tangerine.jpg')
```

```
    ]
```

```
    sql="insert into product values(:1,:2,:3,:4,:5)"
```

```
    for row in items:
```

```
        cursor.execute(sql,row)
```

```
    # cursor.executemany(sql,items) #for문과 동일
```

```
    conn.commit()
```

```
    conn.close()
```

```
insert_many()
```

2.Oracle

□ 레코드 1개 조회

```
import cx_Oracle

def select_one():
    conn=cx_Oracle.connect("pgm/1234@localhost:1521/xe")
    cursor=conn.cursor()
    sql="select count(*) from product"
    cursor.execute(sql)
    count=cursor.fetchone()
    print("상품갯수:",count[0])
    cursor.close()
    conn.close()

select_one()
```

2.Oracle

□ 레코드 삭제

일부레코드 삭제

```
def delete_product():  
    conn=cx_Oracle.connect("pgm/1234@localhost:1521/xe")  
    cursor=conn.cursor()  
    sql="delete from product where product_id=:product_id"  
    cursor.execute(sql,{'product_id':5})  
    cursor.close()  
    conn.commit()  
    conn.close()
```

모든 레코드 삭제

```
cursor=conn.cursor()  
sql="delete from product"  
cursor.execute(sql)
```

2.Oracle

□ 데이터 수정

```
def update(price, product_id):
    conn=cx_Oracle.connect("pgm/1234@localhost:1521/xe")
    cursor=conn.cursor()
    sql="update product set price=:1 where product_id=:2"
    data=(price,product_id)
    cursor.execute(sql,data)
    conn.commit()
    cursor.close()
    conn.close()

price = int(input("Input price : "))
product_id = str(input("Input product_id : "))
update(price, product_id)
all_product()
```

3. MySQL

□ MySQL 테이블 작성

```
create database pydb;  
use pydb  
CREATE TABLE book (  
id INT NOT NULL AUTO_INCREMENT,  
title VARCHAR(200),  
pub VARCHAR(45),  
pages INT,  
author VARCHAR(100),  
PRIMARY KEY (id));
```

□ PyMySQL 설치

콘솔에서 다음 명령어 입력

```
pip install pymysql
```

3. MySQL

□ DB연결

```
conn = pymysql.connect( #pymysql 라이브러리 사용 DB연결
    host= ' localhost ' ,
    user= ' pgm ' ,
    password= ' 1234 ' ,
    db= ' pydb',
    charset='utf8')
```

```
#conn=MySQLdb.connect( # MySQLdb 라이브러리 사용 DB연결
    "localhost",
    "pgm",
    "1234",
    "pydb",
    charset='utf8')
```

```
cursor = conn.cursor()
```

3. MySQL

□ insert

```
sql="insert into pages(title, pub) values(%s,%s)" %(title, pub)
cursor.execute(sql)
conn.commit()
conn.close()
```

```
sql="insert into pages(title, pub) values('%s', '%s')"
```

```
data=tuple('title', 'pub')
```

```
cursor.execute(sql, data)
```

```
conn.commit()
```

```
conn.close()
```

```
sql="insert into pages(title, pub) values(%s, %s)"
```

```
data=[('title1', 'pub1'),('title2', 'pub2'),('title3', 'pub3')]
```

```
cursor.executemany(sql, data)
```

```
conn.commit()
```

```
conn.close()
```

3. MySQL

□ insert example

```
def insert_book(data):
    conn=pymysql.connect(host='localhost',user='pgm',password='1234', db='pydb1', charset='utf8')
    cursor=conn.cursor()
    sql="insert into book(title,pub,page,author) values(%s,%s,%s,%s)"
    cursor.execute(sql,data)
    conn.commit()
    conn.close()

data=('안드로이드','한빛',650,'홍길동')
insert_book(data)
```

```
def insert_book_list(datas):
    conn=pymysql.connect(host='localhost',user='pgm',password='1234',db='pydb1',charset='utf8')
    cursor=conn.cursor()
    sql="insert into book(title,pub,page,author) values(%s,%s,%s,%s)"
    cursor.executemany(sql,datas)
    conn.commit()
    conn.close()

datas=[('안드로이드','한빛',650,'홍길동'),
        ('Oracle DB','한빛',650,'홍길동'),
        ('Spring','영딘',650,'홍길동')]
insert_book_list(datas)
```

3. MySQL

□ select

```
def select_all():
    conn=pymysql.connect(host='localhost',
        user='pgm',
        password='1234',
        db='pydb',
        charset='utf8')
    cursor=conn.cursor()
    sql="select * from book"
    cursor.execute(sql)
    for book in cursor:
        print(book)
    conn.close()

select_all()
```

3. MySQL

□ update example

```
def update_book(data):  
    conn=pymysql.connect(host='localhost',user='pgm',password='1234',db='pydb',charset='utf8')  
    cursor=conn.cursor()  
    sql="update book set title=%s, pub=%s, pages=%s, author=%s where id=%s"  
    cursor.execute(sql,data)  
    conn.commit()  
    conn.close()
```

```
data=('Java', '생능','700','홍길동',1)  
update_book(data)  
select_all()
```

```
def update_book(datas):  
    conn=pymysql.connect(host='localhost',user='pgm',password='1234',db='pydb',charset='utf8')  
    cursor=conn.cursor()  
    sql="update book set title=%s, pub=%s, pages=%s, author=%s where id=%s"  
    cursor.executemany(sql,datas)  
    conn.commit()  
    conn.close()
```

```
datas=[('Java2', '생능','700','최주호',2),  
        ('Java3', '한빛','700','홍길동',3),  
        ('Java4', '길벗','700','박경미',4)]  
update_book(datas)  
select_all()
```

3. MySQL

□ delete example

```
def delete_book(data):
    conn=pymysql.connect(host='localhost',user='pgm',password='1234',
        db='pydb', charset='utf8')
    cursor=conn.cursor()
    sql="delete from book where id=%s"
    #cursor.execute(sql,data)
    cursor.executemany(sql,data)
    conn.commit()
    conn.close()

#delete_book(4)
delete_book([1,2])
select_all()
```

3. MySQL

□ try와 with문

```
import pymysql
conn = pymysql.connect(host='localhost', user='tester', password='7890',
                        db='testdb', charset='utf8')

try:
    # INSERT
    with conn.cursor() as curs:
        sql = "insert into customer(name,category,region) values (%s, %s, %s)"
        curs.execute(sql, ('이광수', 1, '서울'))
    conn.commit()

    # SELECT
    with conn.cursor() as curs:
        sql = "select * FROM customer"
        curs.execute(sql)
        rs = curs.fetchall()
        for row in rs:
            print(row)

finally:
    conn.close()
```
